

**VS**  
**VM Operating System**  
**Release 02.05.00**  
**Software Release Notice**

VS/VM Release, 02.05.00 is a maintenance release of the Wang VS/VM operating system. The last maintenance release of VS/VM was release 02.04.00

**ENHANCEMENTS**

The new VS CPU model VS18000 is now supported in VM. The microcode for this machine is a dual architecture microcode which will support both VSE (pre-7.50) and VSXM (7.50) translation architectures concurrently.

**CORRECTED PROBLEMS**

If a virtual disk existed in more than one extent and a multi-block IO was attempted to it, the length field of the IOCW was incorrectly calculated. The resulting IOSW reported an error.

If a VM file (eg: SYSSTART in @VMDSK) existed in exactly thirteen extents, VM would crash if opened for input.

**VS/VM Problems Open**

If virtual workstations on a real 50V97W serial controller are disconnected and reconnected using the VM commands, they will no longer work properly. This problem is a fault in the 50V97W microcode.
